

# Goodnature E2 Trap Natural Lure

## Goodnature Natural Lure – the ULTIMATE Secret to Success

» When developing poison baits, one has to draw the rodent to the bait, which must also be highly palatable to ensure the rodent consumes a lethal amount of the toxin.

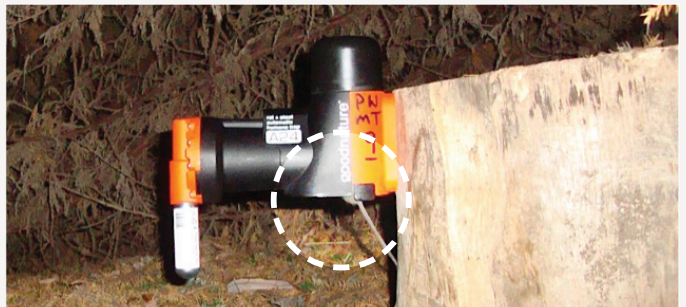

By contrast **the E2 only needs to draw the rodents to the Shroud Chamber, where they brush against the Leaf360 Trigger™ and are eliminated.**

» No toxins are used and the rodents do not eat the lure, it simply draws them to the E2. Whilst we cannot reveal the recipe in our **Rodent Lures**, they have undergone **intensive scientific evaluation** to ensure maximum pulling power by focusing on the attractive olfactory notes that are most desired by rats and mice. **This is the real secret to success.**

» The Lure is slowly released for prolonged periods of time - approximately six months. As the trap needs **minimum servicing**, ongoing costs are curtailed.

» The E2 was **originally designed for use in wilderness conservation projects**, where the traps are spaced at intervals of 50 - 100 m. Station placement for toxic rodent baits is usually recommended at 3 m intervals for mice and 9 m intervals for rats.

» With the E2 in the urban environment, we recommend trap placement at 10 m intervals for mice and 20 – 30 m intervals for rats.

*In a research trial established to target rats only, a mouse (*Mus musculus*) demonstrates the power of the High-performance Natural Rodent Lure by gaining entry to a test unit configured to stop mouse entry!*
